

Hybrid of client-server and P2P

Napster

- File transfer P2P
- File search centralized:
 - Peers register content at central server
 - Peers query same central server to locate content

Instant messaging

- Chatting between two users is P2P
- Presence detection/location centralized:
 - User registers its IP address with central server when it comes online
 - User contacts central server to find IP addresses of buddies

Introduction 1-13

App-layer protocol defines

- Types of messages exchanged, eg, request & response messages
- Syntax of message types: what fields in messages & how fields are delineated
- Semantics of the fields, ie, meaning of information in fields
- Rules for when and how processes send & respond to messages
- Public-domain protocols: defined in RFCs
- allows for
- interoperability
- eg, HTTP, SMTP Proprietary protocols:
- 🗆 eg, KaZaA
- Introduction 1-14

Introduction 1-16

What transport service does an app need?

Data loss

- □ some apps (e.g., audio) can tolerate some loss
- other apps (e.g., file transfer, telnet) require 100% reliable data
- transfer

Timing

 some apps (e.g., Internet telephony, interactive games) require low delay to be "effective"

Bandwidth

- □ some apps (e.g., multimedia) require minimum amount of bandwidth to be "effective"
- other apps ("elastic apps") make use of whatever bandwidth they get

Introduction 1-15

Transport service requirements of common apps

	Application	Data loss	Bandwidth	Time Sensitive
	<i></i>			
_	file transfer	no loss	elastic	no
	e-mail	no loss	elastic	no
V	Veb documents	no loss	elastic	no
real-ti	me audio/video	loss-tolerant	audio: 5kbps-1Mbps	yes, 100's msec
			video:10kbps-5Mbps	
sto	red audio/video	loss-tolerant	same as above	yes, few secs
int	eractive games	loss-tolerant	few kbps up	yes, 100's msec
ins	tant messaging	no loss	elastic	yes and no
_				

Internet transport protocols services

TCP service:

- connection-oriented: setup required between client and server processes
- reliable transport between sending and receiving process □ *flow control:* sender won't
- overwhelm receiver □ *congestion control*: throttle sender when network
- overloaded does not provide: timing, minimum bandwidth guarantees

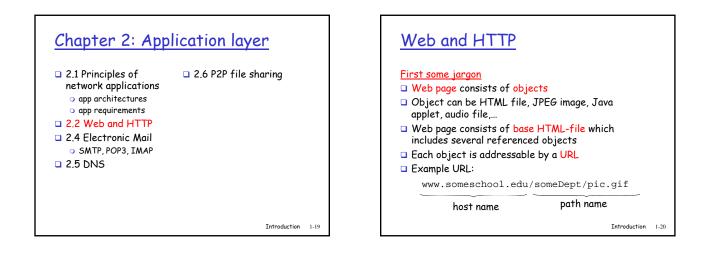

UDP service:

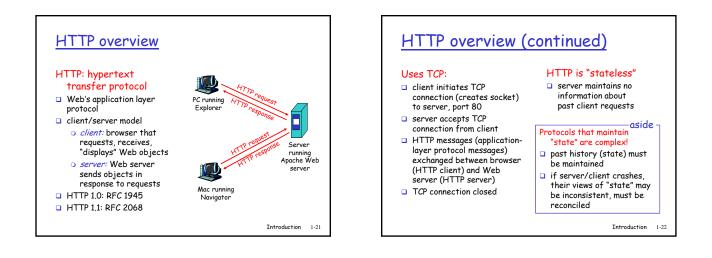

- unreliable data transfer between sending and receiving process
- does not provide: connection setup, reliability, flow control, congestion control, timing, or bandwidth guarantee

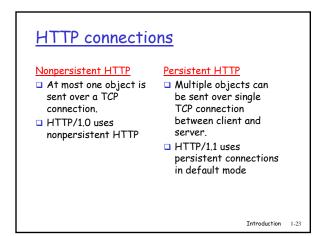

Q: why bother? Why is there a UDP?

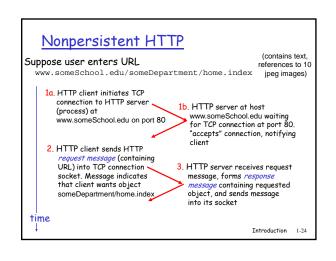

Introduction 1-17

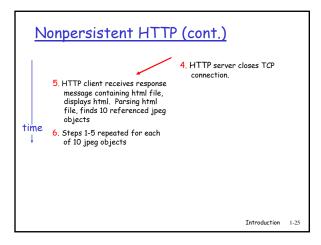

Application	Application layer protocol	Underlying transport protocol
e-mail	SMTP [RFC 2821]	TCP
emote terminal access	Telnet [RFC 854]	TCP
Web	HTTP [RFC 2616]	TCP
file transfer	FTP [RFC 959]	TCP
streaming multimedia	proprietary (e.g. RealNetworks)	TCP or UDP
Internet telephony	proprietary	
	(e.g., Dialpad)	typically UDP

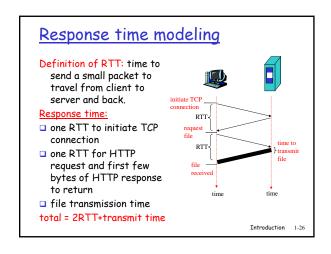

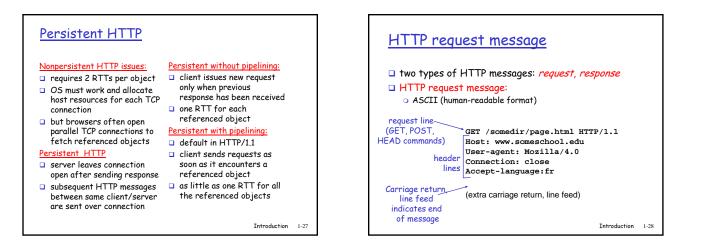

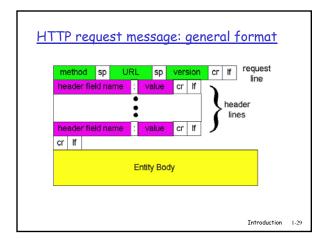

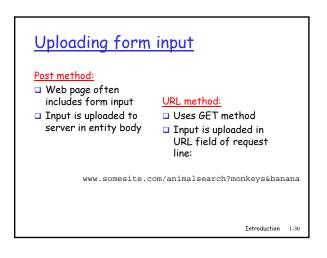

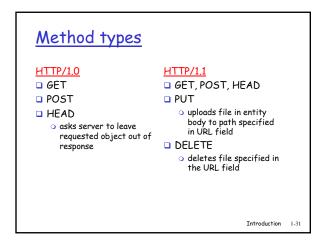

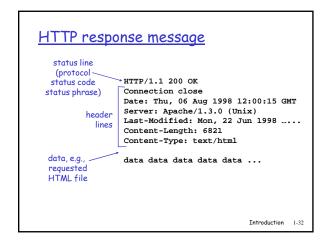

HTTP response status codes

In first line in server->client response message. A few sample codes:

- 200 ок
- request succeeded, requested object later in this message
- 301 Moved Permanently
 - $\odot\,$ requested object moved, new location specified later in this message (Location:)
- 400 Bad Request
- \circ request message not understood by server
- 404 Not Found
- requested document not found on this server
 505 HTTP Version Not Supported

Introduction 1-33
